

The Living Water of Johann Grander

Water can only be truly clean when harmful frequencies have been eliminated from it and vital energies restored.

Austrian naturalist Johann Grander has invented a device that utilises magnetism and spiral motion to reintegrate water's life-force.

CONTEMPLATING THE LAWS OF NATURE

The story of Austrian naturalist, Johann Grander, revolves around the discovery of an extraordinary truth, the far-reaching repercussions of which affect one of the Earth's most precious commodities: our water. It is also the tale of a remarkable man's comprehension of Nature's laws and his quest to open humanity's eyes to the subtle world that exists beyond science, whilst remaining adamant in his decision to retain a life of simplicity and humility despite an increasingly high profile.

From a very early age it was apparent that the young Johann had inherited his father's fascination with magnetism; in particular, its relevance on a cosmic level. His intrigue with Nature's patterns and cycles didn't seem directly related at the time. In hindsight, however, the link of destiny between the two areas becomes abundantly clear.

Born in April 1930 in Tyrol, Austria, he left school and had already completed several jobs by the tender age of 14. Never giving a thought to furthering his education or formalising his instinctive knowledge of all things natural, he just worked hard in order to survive, and gratefully accepted whatever positions were offered to him.

In 1962, whilst leasing a service station, he started to investigate ways to deal with environmentally harmful petrol fumes, and for the first time he became aware of how his understanding of Nature could be harnessed in a practical sense for the good of mankind.

In 1974 his service station lease expired, so he left his home town and withdrew to the surrounding countryside where he earned a living by building wooden alpine huts on high-lying pastures. It was during this period, whilst working on the alpine slopes, that his intense love of Nature consolidated and strengthened and his observations into the "perfection of creation" became more acute.

Craving a suitable place in which to contemplate and restore his inner quietude he purchased a nearby defunct copper mine, believing that it would provide an ideal atmosphere for meditation but not realising that the spring waters, found deep within the mine, would form the basis for a phenomenal discovery and his ultimate invention.

RESTORING THE LIFE-FORCE TO WATER

Water, the most important element for the continuation of all life on Earth should, by rights, always have been treated with the utmost respect, preserved in its natural, unadulterated, pristine state and kept free from human, animal or chemical contamination.

That, of course, has not been the case. Today, we are aware of the degree of physical pollution that has occurred down the ages in the name of progress. But what we have only just begun to acknowledge (largely due to the insight of two dedicated naturalists, Viktor Schauburger and Johann Grander) is that water is much more than its chemical formula H₂O and its real contribution to the well-being of all living matter occurs on a vibrational level.

Grander didn't set out to investigate the vibrations in water. The profound event, which led to his realisation that the life-force within water can be revitalised by infusing it with its own natural frequency, occurred as the result of a totally unrelated incident that came about after doctors declared that his inflamed, arthritic joint was incurable.

"It was up to me to help myself," he said. "My father had told me about the healing powers of magnetism and I built a massage roller which worked like a bicycle dynamo and generated electrical energy when rolled over the body. In this way I cured my arthritis and became familiar with the healing effects of magnetic forces."

This revelation led him to concentrate on the use of magnetism in healing, to build larger, more efficient devices, and finally to invent a way whereby the artificial source of power could be superseded by natural means.

"I was overjoyed to have made such a revolutionary discovery for mankind," Grander declared.

It was a joy which was to be short-lived however, because the authorities refused to patent his invention. Their decision was revealed to be purely political, based solely on a desire to 'protect' industry and commerce.

With the support, understanding and backing of his family, Grander persevered. When asked what motivated him, he replied, "I feel an invisible hand guiding me."

Grander became more and more adept at utilising the inexhaustible natural forces, but eventually he got to the stage where he needed a greater quantity of batteries than he could afford.

A WORLD WITHIN WATER'S SUBTLE VIBRATIONS

He set about inventing what he described as a "water battery" and one day found that when he switched on the circuit, which was now run by water, the high-frequency energy from the magnetic generator was transferring permanently to the water.

In other words, Grander's simple but sensitive process was re-activating our damaged water with a vibration that had been lost

Johann Grander, naturalist and water revitaliser

Water has the property of being able to transfer information which has entered its memory, to other systems such as living organisms.

for aeons, and at the same time it was restoring its innate vitality.

All of Nature is a 'living being' in mutual vibration with itself. Its dance involves a constant attraction, rejection and transformation and the subsequent release of power, both positive and negative. Water, our most important storage medium, absorbs all the influences in its environment and then passes them onto other living organisms.

Today, the damaged, polluted, artificial landscape through which water flows is producing mostly negative frequencies which, in turn, adversely affect the physical, emotional and spiritual well-being of all life on Earth.

Johann Grander's discovery has opened the door to the reversal of this negative trend by restoring water's natural vibrations and life-force. All that is required is for the authorities to have the insight to see beyond the known, and the courage to take the first step.

The human body is said to be composed of 75 per cent water, and the brain tissue made up of 85 per cent water. To maintain bodily

functions a human needs three litres of fluids a day, for a lack of water will result in certain death over a period of three days because the body can't retain its own reserves.

Humanity has been aware of the preciousness of water for thousands of years. In Rome its contamination was punishable by death, but modern society, driven by progress and a relentless desire for prosperity, has abused its waterways and destroyed water's very essence.

Today, a huge proportion of the world's water supply is undrinkable; not only is it 'sick' or 'dead' water, it is devoid of life-force. This has serious implications for the health of entire populations.

Forced to conform to our highly questionable standards, water is raped by chemicals, effluent, fertilisers, pesticides, acids, fumes, hydrocarbons and fluorocarbons; shoved through tortuous routes using pumps and filters; and then subjected to 'purifying and cleansing' processes until it becomes a commercially viable product which is 'fit for human consumption'.

Water, in its natural state, sustains and renews itself with energy (frequencies) from the stones, rocks, minerals and, indeed, the planets in our solar system. In Nature, every source has a different energy and a different taste because its contents vary according to the minerals and frequencies contained within.

Grander says: "In Nature, water seeks its energy resources by itself and for this it needs its liberty. Natural water flows over and under the earth; it forms its own loops and bends and the entire vegetation benefits from this. Now we deprive water of this liberty by forcing it into canals, by regulating riverbeds, by pressing it through pressure pipes, by adding harmful substances and exposing it to environmental pollution."

WATER POSSESSES MEMORY

By far the most profound and progressive aspect of Grander's discovery was his realisation that water possesses memory. Any life-impeding information that water gathers in the form of harmful vibrations (or information) is not erased by any of our conventional cleansing or purifying processes.

Grander asserts that water is still harmful even after being subjected to filtration and purification processes. He says: "Water, once impaired by metals, nitrates, toxins, etc., remains harmful

even after a thorough processing by chemicals or filtration because negative vibrations that once were stored are still preserved. This is the reason why the use of water is so precarious today. Drinking water may be filtered, irradiated and chemically processed but the harmful vibrations are still being passed on to the organisms of living beings."

Once water has been contaminated with pollutants and damaged, by constantly being forced into unnatural shapes and contours, it is energetically dead and even the best regenerating plants cannot restore it to life.

Modern research confirms that even after chemical or mechanical removal, harmful toxic materials remain present in water in the form of electromagnetic frequencies. These negative oscillations are transferred to the human body and can cause a range of sometimes inexplicable allergies or sickness.

The physicist, Dr Wolfgang Ludwig, explains in the book, *Environmental Medicine*, that: "Water has the property of being able to transfer information which has entered its memory, to other systems such as living organisms. What most people do not yet know is the following fact: while water may have been chemically cleaned and all bacteria eliminated, it still possesses certain electromagnetic frequencies or vibrations of certain wavelengths which, when we take a closer look, can clearly be allocated to exactly the pollutants which were supposedly removed. So even after regeneration, water still contains certain signals which, depending on their wavelength, may be injurious to health."

Dr Ludwig goes on to reveal that certain electromagnetic frequencies of water, polluted with heavy metals, have been found in cancerous tissue. He says that in one German metropolitan area the drinking water, prior to its distillation, had a frequency of 1.8 hertz (very low life-energy) and that experimentation showed that although it had been treated and distilled twice, the low frequency 1.8 hertz still remained—proving that although the drinking water was chemically pure, it remained physically contaminated with pollutant information and therefore retained a low life-force.

Once it is recognised that all living matter is constantly exchanging (giving and taking) vibrations (information), it follows that living matter always seeks the vibration it lacks. Thus our damaged water, which is very low in both energy and vibration, is depleting instead of nourishing us (which may go towards explaining the feeling of tiredness after having a bath.)

A SIMPLE SOLUTION: A PROFOUND INVENTION

Several years after his initial discovery, and after much contemplation in a little wooden hut (which combined as a laboratory and a new 'meditation centre'), Johann Grander invented the now widely acclaimed Living Water energising unit, which captured brilliantly his 'accidental' concept for revitalising water in such a way as to make energised water accessible to everyone.

The potent cleansing and health-giving properties of water have been recognised for a long time, and eminent researchers such as Viktor Schauberger, Theodore Schwenk, Fritz Koch, Henri Coanda, Nikola Tesla, Samuel Hahnemann (the father of homeopathy) and Anton Mesmer had all pre-empted Grander's work.

But Grander discovered what centuries of study by notable scientists, physicists and chemists had failed to find: the key to duplicating Nature's ability to restore a range of vibrational frequencies to water and energise it like a mountain spring. And now he had developed a practical and useful unit for doing just that.

"The high energy which flows from my device cannot be compared with the energy from a power socket," he said. "It is a natural energy in every sense of the word, made up of light vibra-

Implosion experiment with water, carried out by Walter Schauberger

tions. These are natural, vital forces, the strongest of which you can touch without getting an electric shock."

Grander's vision took him where no one else had gone. In fact, his discovery has been described as being as "significant as electricity and the silicon chip" because to possess the knowledge to restore water's life-giving frequencies is to hold the key to transmute all the damage that has ever been done to it by human and chemical pollution and, ultimately, to return to the world its most vital 'element'.

Many countries offered him millions of dollars to buy the secret to his alternative source of energy, but, because he feared that his inventions could end up either getting shelved or placed in the wrong hands, he renounced all offers despite his serious financial difficulties at the time. He says: "I regarded my discovery as a divine inspiration which ought to be further developed."

GRANDER'S LIVING WATER FOLLOWS NATURAL LAW

Hans Kronberger, in his book, *On the Track of Water's Secret*, says: "It is not a theory of miracles that Johann Grander teaches. For him, his research has a simple self-evidence. Grander feels like a 'servant' who is in a position to recognise certain natural processes. His results are far from being miracle cures or some kind of supernatural knowledge... The only miracle is Nature itself."

Grander perceives life to have a spiritual, not a magical, thread which holds it together, and he humbly accepts everything that occurs on his journey as a gift from God.

He says: "As I see it, not a single event in our lives is based on coincidence. This is why I believe that being aware of the fact that everything God allows to happen is important and could help many people to cope with their daily problems, even if they don't immediately see the sense... I was virtually guided towards the water. So, of course, it was not a coincidence... I am grateful that I was allowed to acquire this knowledge for the benefit of the entire creation."

"Above all, I consider it to be a grace that I was allowed to come to this state of humility, which I want to preserve by all means. Because only by this humility, the divine guidance and the divine protection will be maintained... I have recognised how important it is to let oneself be guided instead of always trying to succeed with one's obstinacy."

Explaining the Living Water unit, Grander says that magnetism is information, vibration or power that flows from one pole to the other, and that there is always a giving and a taking pole, corresponding to the principles of plus and minus, yin and yang, etc.

He explains: "With magnetism we draw a distinction...that is, earth or permanent magnetism, which is stationary and in which only certain energies flow and only certain materials (iron) are attracted and ejected; and gravitational magnetism, which is bound to time and space and in which several energies flow and all materials are attracted. And finally, as the highest form, the spiritual or planetary magnetism, which is neither bound to space nor to time, and by which all hereditary information and all vital powers are transmitted. No life would be possible without it. It regulates the mechanism of the three cycles (cycles of the year, month and day) between plus and minus."

Grander's Living Water unit is poled in such a manner that all three forms of magnetism are integrated. He says: "All three natural magnetisms are amplified so that energy starts to flow. This cosmic energy, which is highly efficient and, above all, harmless, changes the structure of the water so that it gains specific magnetic characteristics and high-grade hereditary information... It is the implosive energy that works. Contrary to the explosive energy, which is harmful and destroys Nature, this implosive energy is a gentle, absorbing power which flows from the outside to the inside."

LOW ZETA-POTENTIAL MEANS A CLOGGED SYSTEM

It has been said that Johann Grander's water is the closest mankind has got to producing cellular water—which has trace elements in a special colloidal form that are insoluble in water, do not ionise, and remain suspended due to a natural law known as "zeta potential".

This is the phenomenon by which the billions of circulating cells maintain their discreteness, thus playing a vital role in all forms of animal and plant life. If zeta potential is low, toxins cannot be suspended for elimination and nutrients cannot be suspended

for transportation to the cells—so the whole system becomes clogged.

For hundreds of years others have tried to reproduce cellular water but, before Living Water, no one was able to recreate its unique health-giving properties.

As Hans Kronberger points out that, until relatively recently, Grander's work and discoveries caused him to be labelled a "crackpot" and he was left alone to think and observe in his own beloved natural environment.

Now, since Grander's discovery and invention of 'revitalised' water, doctors, scientists and naturalists come from all over the world to consult with him. Numerous attempts have been made to discredit him and halt his developments, but none has succeeded.

He reflects on the first 10 years of his work, when nobody came to see him, and says that this was one of the most beautiful times of his life. There have been practically no media reports on him because, with the exception of Hans Kronberger, he refuses to have contact with journalists.

In a conversation which took place around a table with friends, and at which Hans Kronberger was present, he spoke of his sadness concerning the fact that most people today have lost their knowledge "of what really happens in Nature and what is really important in life".

He said: "It often hurts when I have to look on and see such a false picture being drawn for people that causes them to become ignorant and blind in respect of Nature. And that is why I wish people themselves would start to think about the processes of Nature again and, through this, learn to respect Nature again... Because this knowledge about Nature can, for the most part, only come from within themselves."

When asked why he doesn't reveal the secret of his Living Water, he replied: "It is not a secret but a natural law. The fact that to many people it seems to be a secret indicates how far science has already digressed from Nature."

It has been said that Johann Grander's water is the closest mankind has got to producing cellular water—which has trace elements in a special colloidal form that are insoluble in water, do not ionise, and remain suspended due to a natural law known as "zeta potential".
